## **1 Progress Update**

### **1.1 Progress Fourth Week**

During the fourth week of my industrial training at Mukono District, I gained practical experience in network administration, structured cabling, and biometric system integration. The activities focused on maintaining ICT infrastructure, configuring network devices, and ensuring reliable communication between hardware components within the organizational environment.

I participated in structured network cable termination and network expansion activities, which involved preparing Ethernet cables, performing cable termination, extending network access points, and testing physical network links. I assisted in verifying network connectivity between devices to ensure proper signal transmission and reliable communication across the local area network (LAN).

Additionally, I participated in the configuration and deployment of a biometric registration system by migrating the device connectivity from a wireless network environment to a wired Ethernet connection. This involved adjusting network parameters, establishing wired communication, and performing system verification tests to confirm successful data transmission between the biometric device and the connected network infrastructure.

Through these activities, I developed practical knowledge in network installation, Ethernet cabling standards, LAN troubleshooting, hardware configuration, biometric system integration, and network performance verification. The experience enhanced my understanding of how ICT infrastructure components work together to support secure and reliable organizational operations.

## 1.2 Progress Seventh Week

During the seventh week of my industrial training, I gained practical exposure to enterprise database management and ICT system administration through my involvement with the Electronic Government Procurement (eGP) database system. The activities focused on understanding database architecture, data relationships, information processing workflows, and technical support operations within a government information system environment.

I analyzed the structure of the eGP relational database and examined the relationships between different database entities, including supplier registration, procurement plans, tenders, bid submissions, evaluations, contracts, reports, and system users. This provided practical experience in understanding database schemas, data organization, entity relationships, data integrity, and information retrieval processes within a large-scale information management system.

I also explored how procurement data flows through different stages, from supplier registration and procurement planning to tender management, bid evaluation, contract administration, and reporting. This improved my understanding of how database systems support transparency, accountability, and efficient decision-making through structured data management.

In addition to database-related activities, I participated in ICT infrastructure support tasks, including BIOS and firmware updates, Microsoft Office deployment and configuration, wireless network driver installation, biometric system fault diagnosis, and wireless router configuration. These activities strengthened my skills in system maintenance, software configuration, hardware troubleshooting, and network administration.

Overall, the fourth and seventh weeks significantly enhanced my technical competencies in network engineering, database administration, system integration, hardware diagnostics, and ICT infrastructure management. The practical experience gained contributed to my understanding of how enterprise information systems are designed, maintained, and utilized to support organizational efficiency and service delivery.
